Submission readiness, declarations and remaining evidence

Review date: 8 November 2026. Evidence cutoff: 31 October 2026. This register evaluates an exploratory retrospective model-comparison paper, not a clinical deployment system. Editorial quality, complete reporting, empirical validity and journal fit are separate judgments. A high writing score does not supply a missing ethics determination or an unperformed experiment.

1. Current disposition

The manuscript and supplement can accurately present a bounded development comparison, including the negative graph-versus-pooling result and its control limitations. The documentation revision corrects factual errors, consolidates methods and project history, adds source-linked reporting compliance, and records internal review. Submission remains conditional on author declarations, cohort characterization and journal selection. Stronger predictive, mechanistic, explainability or clinical claims require additional evidence.

The primary reporting framework is TRIPOD+AI, with STROBE cohort reporting as an adjunct and PROBAST+AI for bias/applicability concerns. These are reporting or appraisal frameworks, not acceptance guarantees. The official-source item-level review provides the crosswalk.

2. Author facts required before submission

Requirement	Current evidence	Required completion
Journal/article type	Working format selected: JAMIA Research and Applications	Author approves submission target; current format limits verified from official instructions.
Names, order, affiliations	User supplied Pronab Chandra Roy; Lihui Liu, in that order, with no institutional affiliations	Both authors approve authorship eligibility/order, contact email, corresponding-author responsibility and accountability.
Secondary-analysis ethics	Original clinical study approval is cited; local secondary determination absent	Obtain/confirm applicable institutional approval, exemption or non-human-subject determination and identifier; do not claim one was granted without evidence.
Consent/data-use terms	Public-use source release identified	Confirm applicable consent/waiver language, access conditions, required attribution and redistribution permissions.
Funding	Not confirmed	Supply funding/grants or an accurate author-confirmed no-funding statement.
Competing interests	Not confirmed	Obtain declarations from every author.
Contributions	Not confirmed	Assign and approve contributor roles; AI tools cannot take authorship responsibility.
Patient/public involvement	Not confirmed	State actual involvement or author-confirmed absence; do not infer.
AI disclosure	Analysis and writing assistance disclosed in draft	Confirm tool/model versions, dates, roles and author verification; adapt to the selected journal and current ICMJE guidance.
Code release	Local implementation exists; final public archive/license/environment not confirmed	Author-reviewed repository/archive identifier, license, dependencies, immutable revision and protected-data exclusions.
Source release citation	Jaeb collection and local release date documented	Confirm precise custodian citation and any applicable DOI or required acknowledgement.

The pending questions were requested from the author during preparation. Unanswered items remain visible in the manuscript and are not silently converted into "none" statements. ICMJE authorship guidance and AI-use guidance describe the relevant responsibilities.

3. Empirical reporting gaps and claim-dependent requirements

Area	Current disposition	What would resolve it
Analytic population dates and characteristics	Source-study context reported; actual released-group spans/demographics missing	Authorized aggregate characterization of the 835/652 population, group missingness, dates, therapy/device context and subgroup sample sizes.
Optimization fairness	Two-epoch campaign plus one eight-epoch fold/seed	Predeclared training-side tuning, learning curves, comparable optimization budgets and replication; cannot infer convergence from 8 epochs alone.
Isolated graph mechanism	Pooling changes fusion and CGM-only path	Same-path factorial control varying only the message operation, if a mechanistic claim is desired.
Incremental event value	Early effects change with comparator/seed/schedule	Strong matched CGM-only baseline and same-schedule multi-fold/multi-seed event-input controls.
Calibration	Brier reported	Calibration curve/intercept/slope and any recalibration fitted outside performance-test data.
Alert performance	Proposed utility code, no completed clinical operating-point analysis	Predefined threshold-selection split, refractory rule, observable episode matching, false alerts/day, event sensitivity and warning lead times.
Availability	Occurrence-time immediate replay	Measured first-usable times or clearly simulated delayed-event scenarios on identical admissible inputs.
Explanation	Selection-conditioned deletion screen	Independent selector/evaluator, recency/value/type/size-matched controls, perturbation validity, stability and appropriately scoped domain review.
Reserved performance evaluation	No reported model scores	Freeze full analysis/model rule before one protected evaluation; earlier aggregate inspection must remain disclosed.
External graph/event transfer	CGM-only logistic transfer completed	Resolve clocks/units/basal/bolus semantics; source-train shared insulin-only input version; freeze adapter/model before external outcomes.
Prior-art absence	70 curated records, targeted source review	Native database exports, study-family deduplication, screening and missing full texts if a systematic or "first" claim is sought.
Fairness/representativeness	No demographic subgroup assessment	Source-grounded demographic characterization and prespecified subgroup uncertainty; otherwise retain explicit limitations.

Not every exploratory methods paper must include clinical deployment or external graph experiments. However, those missing outputs prohibit corresponding claims. The strongest current defensible result concerns the implemented models on the retained Loop development windows under the tested schedules. No equivalence, causal treatment effect, clinical prevention or general graph-family conclusion is justified.

4. Reproducibility prerequisites and provenance limits

Two source basal tables are absent locally; a clean raw-to-cache rerun requires reacquisition under the source terms. Current aggregate builds can verify cached/archived comparisons but do not recreate missing upstream source files. Earlier fit fingerprints differ across some campaigns; preserve their exact archived source and

distinguish explanatory current code from bitwise historical reproduction. Some typed-pilot raw prediction recovery remains unconfirmed. Independent summary receipts verify their recorded computations, not every methodological assumption.

The shareable dossier uses an explicit allowlist and excludes data/, private/, downloaded clinical bundles, raw prediction records and temporary event partitions. A complete public software release is a separate author-reviewed artifact. A working Git tree with uncommitted research changes is not an immutable code release.

5. Release-quality checks for this documentation delivery

The delivery verifier must establish: every research document in the defined inventory scope is indexed; main results reconcile to the existing evidence build; cited references exist and are ordered by first use; all main tables and figures are present; no unresolved result-template tokens remain; DOCX XML and ZIP integrity pass; PDFs compile from the current sources and contain current key text; referenced local files exist; reviews and before/after ratings are delivered; remaining author/empirical requirements remain visible; and all package members match their SHA-256 manifest. The final machine-readable dossier audit records these checks and their limitations.

6. Selected working journal format

JAMIA **Research and Applications** is the working format selected on 8 November 2026. The official instructions specify main text up to 4,000 words, a structured abstract up to 250 words, up to 4 tables and 6 figures, and no more than 5 keywords. The present main paper uses three tables, two figures with alt text, five keywords and the prescribed abstract headings. Body and abstract counts are reported by the dossier verifier; a conservative body count includes declarations and legends while excluding table rows. The Word and LaTeX versions are double-spaced, and figure legends are at the end. This is format preparation, not a prediction of editorial acceptance.

The official instructions' citation eligibility language requires editorial confirmation for the relevant thesis, conference proposal and preprints. These works materially constrain novelty and cannot be silently omitted or presented as peer-reviewed journal evidence. Their status remains explicit in the references and source review. AI disclosure must also appear in the eventual cover letter. A data-availability statement and author-approved CRediT roles are required. The internal TRIPOD+AI crosswalk is adopted as reporting best practice; no unverified blanket journal mandate is claimed.
